

FIBU iOS APPLICATION

Bug Report & Issue Log

Reported By	Date	Platform	Total Issues
Mostaque Shahriar Tonmoy	March 24, 2026	iOS (Multiple Versions)	13 Issues Logged

Executive Summary

This report documents 13 bugs and feature deficiencies identified in the Fibu iOS application across subscription management, compiler functionality, UI/UX, and data persistence. Issues range from critical revenue-impacting bugs (subscription not activating) to accessibility concerns (cursor visibility) and core functionality failures (user input not supported in the compiler). Each issue below includes a description, expected behavior, actual behavior, and recommended resolution where applicable.

Priority Overview

Issue #	Issue Title	Priority
#1	Pro Subscription Activation Failure	High
#2	Python Programming Not Working	High
#3	Comment Count Not Showing on Forum Post	Medium

#4	Code Execution Hangs with Spinning Loader	High
#5	Cursor Visibility Issue in Mobile Compiler	Medium
#6	Screen Non-Scrollable for Longer Code	High
#7	Java Compiler Requires 'Main' as Class Name	Medium
#8	Mobile Compiler Does Not Support User Input	High
#9	Web Projects Not Being Saved	High
#10	Subscription Status Screen Showing to Pro Users	High
#11	Forum Comment Count Not Updating in Real Time	Medium
#12	Create Project Modal Does Not Dismiss	Medium
#13	Cannot Scroll to Bottom of Project List	Medium

Detailed Issue Reports

Issue #1: Pro Subscription Activation Failure 	
Priority	High
Summary	Users are unable to access Pro features immediately after a successful purchase.

Description	Some users who have completed the payment process for a Pro account are still being restricted by the paywall and cannot access premium content.
Expected Result	The user's account status should update to 'Pro' instantly after a successful App Store transaction.
Actual Result	The account remains on the 'Free' tier despite a successful charge.
Notes / Suggestion	<i>Likely involves an issue with App Store Receipt Validation or the webhook that updates the user's subscription status in the backend.</i>

Issue #2: Python Programming Not Working	
Priority	High
Summary	Python programming environment is non-functional; terminal is inaccessible for installing packages.
Description	Users cannot run Python code within the app. The terminal required to install Python packages is not visible or accessible, and an error message is displayed instead.
Expected Result	Users should be able to run Python code and access the terminal to install required packages.
Actual Result	Terminal is not shown and an error message is displayed, making Python programming impossible.

Issue #3: Comment Count Not Showing on Forum Post

Priority	Medium
Summary	Forum posts do not display the correct comment count.
Description	When users post or view comments on forum threads, the comment count indicator on the forum post does not update or display properly.
Expected Result	The comment count should accurately reflect the total number of comments on a post.
Actual Result	Comment count is not shown or not updated on forum posts.

Issue #4: Code Execution Hangs with Spinning Loader

Priority	High
Summary	Running code within a lesson causes an infinite loading state.
Description	When a user attempts to run code in a lesson, the app displays a spinning planet animation and hangs indefinitely without executing the code or returning a result.
Expected Result	Code should execute and return output (or an error) within a reasonable time.
Actual Result	The app just sits with a spinning planet loader and never completes execution.

Issue #5: Cursor Visibility Issue in Mobile Compiler

Priority	Medium
Summary	The cursor color in the mobile compiler is too faint, causing accessibility issues.
Description	The cursor in the mobile code editor is difficult to see, particularly for users with visual or eye-related difficulties. This creates a significant accessibility barrier for a core feature of the app.
Expected Result	The cursor should be clearly visible at all times, especially for users with visual impairments.
Actual Result	The cursor color blends with the editor background, making it nearly invisible.
Notes / Suggestion	<i>Recommended fix: Set cursor color to black, or provide a user-configurable cursor color option to improve accessibility compliance.</i>

Issue #6: Screen Non-Scrollable for Longer Code

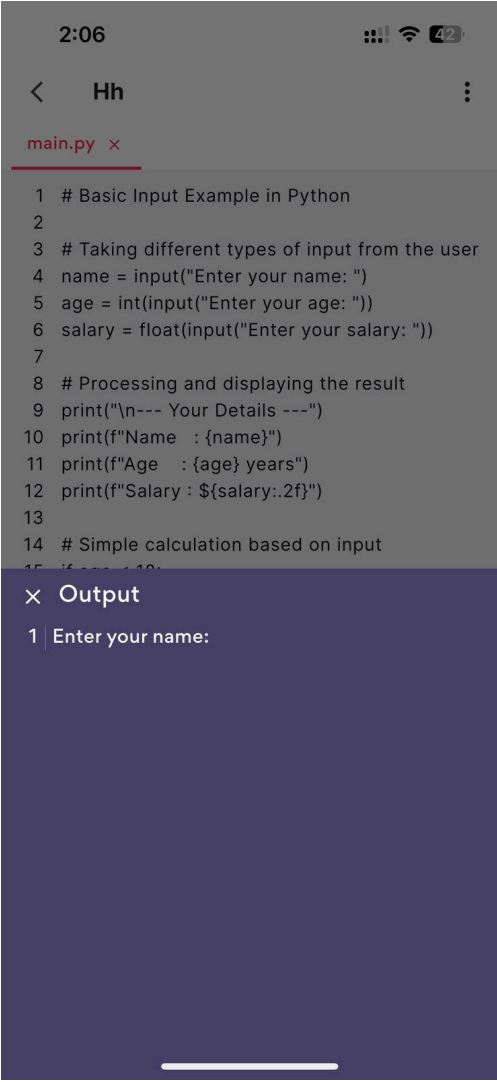

Priority	High
Summary	Mobile editor screen becomes unscrollable when writing long code, preventing access to lower content.

Description	While writing lengthy code in the mobile app's editor, the screen stops responding to scroll gestures. Users are unable to reach or edit code written at the bottom of the editor, making error correction impossible.
Expected Result	The editor should always be scrollable, allowing users to navigate to any part of their code.
Actual Result	The screen becomes locked and cannot be scrolled, and the lower portion of code is inaccessible for editing.

Issue #7: Java Compiler Requires 'Main' as Class Name	
Priority	Medium
Summary	Java code only executes if the class is named 'Main', limiting standard Java development practices.
Description	The app's Java compiler/runtime only executes code when the public class is named 'Main'. Any other valid class name with a public static void main(String[] args) method fails with ClassNotFoundException: Main.
Expected Result	The compiler should automatically detect and run the class containing the main method, or allow users to specify which class to run.
Actual Result	Error thrown: 'Could not find or load main class Main / ClassNotFoundException: Main' when any class name other than Main is used.
Notes / Suggestion	<i>Suggested improvements: (1) Auto-detect the class with the main method, (2) Allow users to specify/select the main class, or (3) Document this limitation clearly in the app UI.</i>

Issue #8: Mobile Compiler Does Not Support User Input

Priority	High
Summary	Programs requiring user input (cin, scanf, Scanner) do not function in the mobile compiler.
Description	The mobile compiler does not provide any mechanism for user input during program execution. Code that relies on standard input (such as cin in C++, scanf in C, or Scanner in Java) does not work as expected, making interactive programs impossible to test.
Expected Result	The compiler should provide an input field or console to allow users to enter values during program execution.
Actual Result	No input mechanism is provided; input-dependent programs fail or hang silently.

	 A screenshot of a mobile application interface. At the top, the status bar shows the time 2:06, signal strength, Wi-Fi, and 42% battery. Below the status bar is a navigation bar with a back arrow, the text 'Hh', and a menu icon. The main content area shows a code editor with a file named 'main.py'. The code is a Python script for a basic input example. Below the code editor is an 'Output' section with a text input field containing 'Enter your name:'. <pre>1 # Basic Input Example in Python 2 3 # Taking different types of input from the user 4 name = input("Enter your name: ") 5 age = int(input("Enter your age: ")) 6 salary = float(input("Enter your salary: ")) 7 8 # Processing and displaying the result 9 print("\n--- Your Details ---") 10 print(f"Name : {name}") 11 print(f"Age : {age} years") 12 print(f"Salary : \${salary:.2f}") 13 14 # Simple calculation based on input 15 if age < 18:</pre> × Output 1 Enter your name:
Notes / Suggestion	<i>This is a critical limitation for learners, as most basic programming exercises rely on user input. The limitation should be either resolved or clearly documented in the app.</i>

Status : not completed ▾

Issue #9: Web Projects Not Being Saved	
Priority	High

Summary	Web projects do not persist after closing or refreshing, leading to data loss.
Description	Users' web project data is not saved properly. Upon closing or refreshing a project, all work is lost as the changes are not persisted to the backend.
Expected Result	Web projects should be auto-saved or saved on user action, and all data should persist across sessions.
Actual Result	Project data is lost after closing or refreshing the page/app.

Issue #10: Subscription Status Screen Showing to Pro Users	
Priority	High
Summary	Active Pro subscribers are incorrectly shown the 'Upgrade to Pro' sales screen.
Description	Existing Pro users see the subscription sales screen (\$9.99/mo or \$49.99/yr) when navigating to the subscription section. Clicking it prompts them to purchase again, causing confusion.
Expected Result	Pro users should see a Subscription Status page showing: Active Plan (Monthly/Yearly), Remaining Duration, and a confirmation message that they are a Pro User.
Actual Result	Pro users are shown the sales/purchase screen as if they are not subscribed.
Notes / Suggestion	<i>Implement a subscriber logic check: Non-Pro users see the sales screen; Pro users see a status dashboard with plan details and remaining time.</i>

Issue #11: Forum Comment Count Not Updating in Real Time

Priority	Medium
Summary	Comment count on forum posts does not update in real time after a user posts a comment.
Description	After submitting a comment on a forum post, the comment count displayed on the post listing does not reflect the new comment immediately. Users must refresh manually to see the updated count.
Expected Result	The comment count should update in real time after a comment is posted, without requiring a page refresh.
Actual Result	Comment count remains stale after posting a comment until the user manually refreshes.

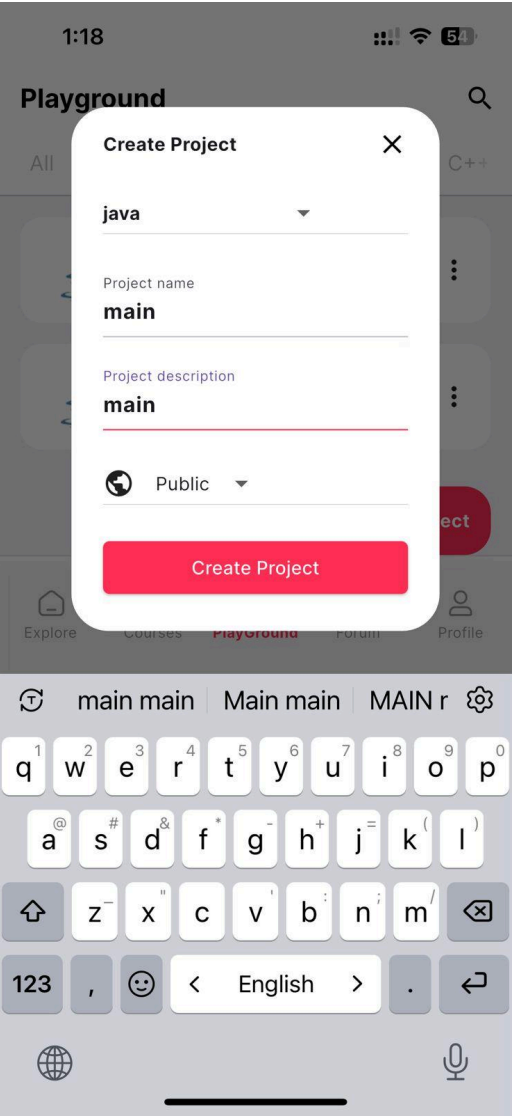

Issue #12: Create Project Modal Does Not Dismiss

Priority	Medium
Summary	The 'Create Project' modal remains on screen after the user submits the form.
Description	When a user clicks the 'Create Project' button inside the modal, the modal does not close. It stays on screen, leaving the user unsure whether the project was created successfully.

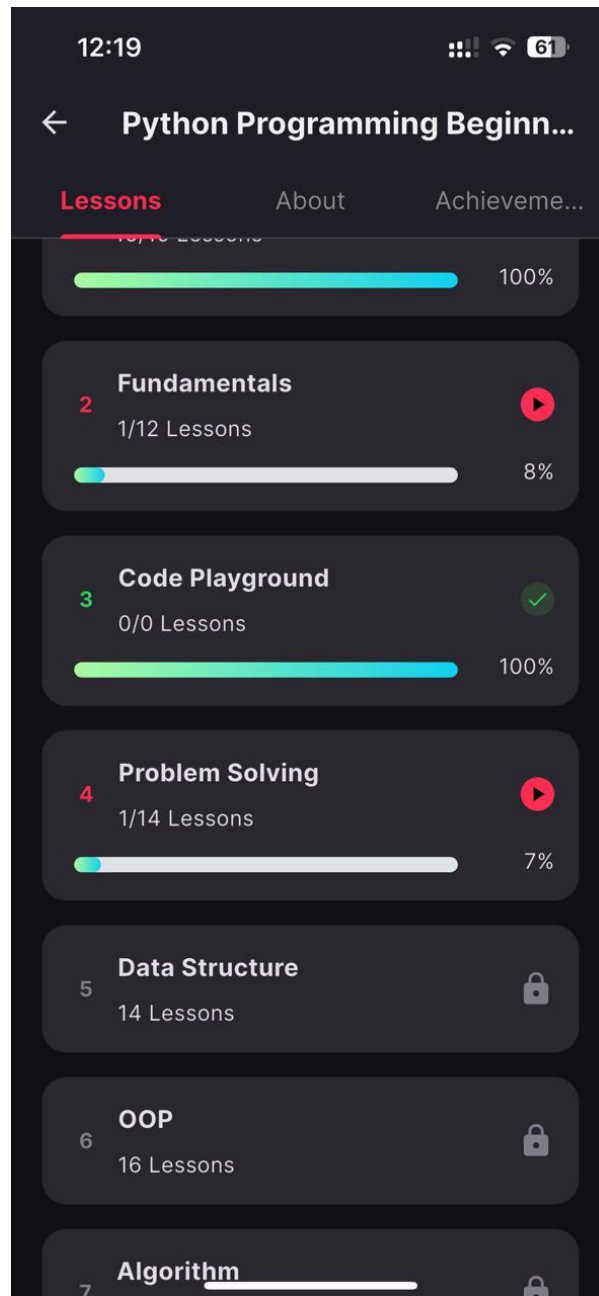

Expected Result	After clicking 'Create Project', the modal should close and the new project should appear in the project list.
Actual Result	The modal remains visible on the screen after the button is pressed.

Issue #13: Cannot Scroll to Bottom of Project List	
Priority	Medium
Summary	The project list view is not fully scrollable, cutting off projects at the bottom.
Description	On the project list screen, users are unable to scroll to the bottom of the list. Projects below the visible area are inaccessible, preventing users from finding and opening older projects.
Expected Result	The project list should be fully scrollable so all projects are accessible.
Actual Result	Scrolling stops before reaching the bottom, leaving lower projects unreachable.

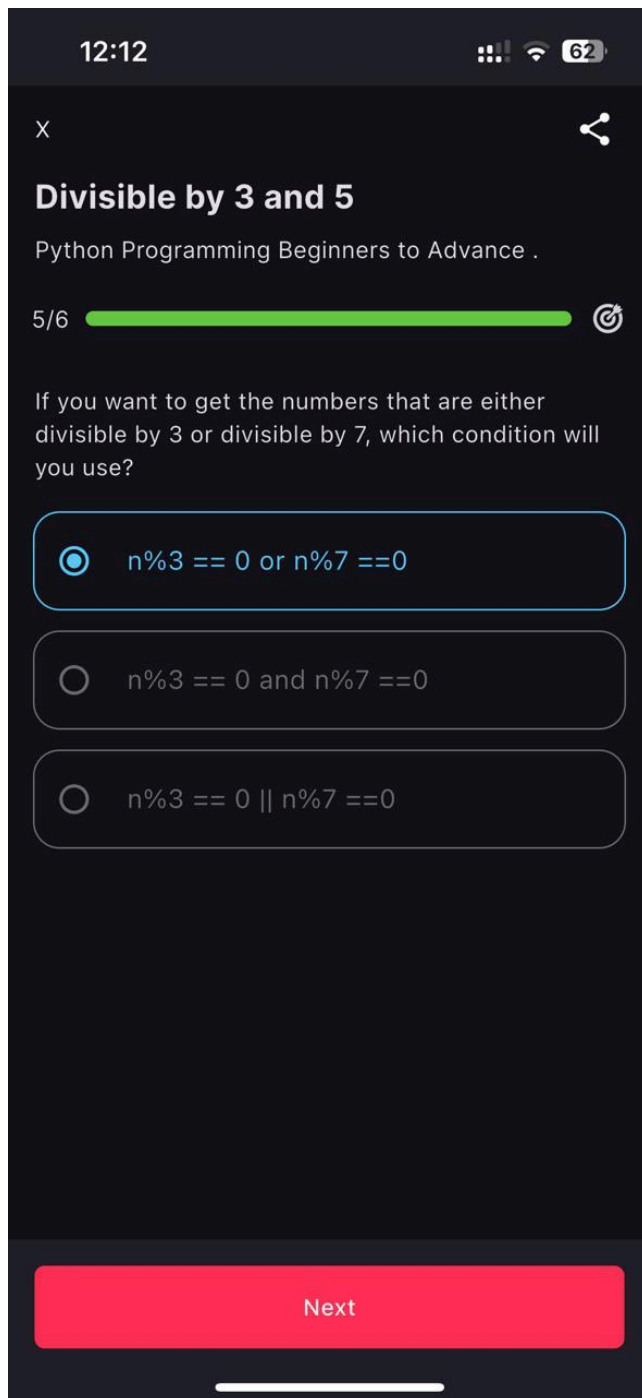

Issue #14: Some times project are not created . Specially on java .	
Priority	Medium

Description	When i am going to create a project some times it's not created .
	

15 . Some times when user complete on lesson , but in the module list app do not show that the lesson is complete . It keeps the previous data .

16 . In some of the quiz test , when user press the quiz one of the option , in that time app do not show any modal or popup option .

17 . The flickering issue still exists. Please solve it.
